

Single Whip Regulated Paintball Fill Panel

SKU: PN1R

Price: ?810.00

Description

For use with paintball systems. This single-whip fill panel is constructed of stainless steel and high quality fittings. It is custom built at our California production facility. The panel can be installed and operated at the paintball field or in a shop. The station includes an adjustable pressure regulator mounted on the fill station, a pressure gauge, and a toggle actuated fill valve that relieves line pressure when released. A rubber weight on the included fill hose prevents whipping if accidentally pressurized without a tank connected.

Dimensions with fittings, no hose (W×D×H): 14-1/8×14-3/4×9 in. The max working pressure is 5000 psi (345 bar).

All paintball fill panels are custom-made. Please [contact](#) the sales team for estimated lead times.

See our [Paintball Accessories Page](#) for hoses and fill adaptors that can be used with our station.

Please Note: Fill panels are a gas management tool. Fill panels do not generate compressed air. A source of compressed air is required to fill tanks.
